Manual RevSist

Claudio Bustos

Search

The first step on RevSist after create a systematic review is to perform one or more searchs on the academic indexes that the system provide. Currently, we support: * Scopus * Wos * Scielo * Redalyc (not implemented yet) * Ebscohost * Refworks (basic support)

After entering on the menu, you should create a new search with *New search*. The fields are:

- Database: Select one the databases
- Date: Date when you make the query. Use yyyy/mm/dd
- Search criteria: Just copy-paste the query you use. The idea is if you need to replicate the search, you just have to use this query
- Description: A text description explaining your query
- File: Field to upload the result of the query.
- Scopus: Use export to Bibtex, with all fields selected
- WOS: Use export to Bibtex with all fields selected
- Scielo: (Don't remember)
- Redalyc: NOT YET IMPLEMENTED
- Ebscohost: Don't remember. . .
- Refworks: Maybe the csv. . .

After you insert all searchs, you should press 'process' to create *records* and *references* for each search. Now, on each search, you should see how many *records* you just create.
